WEATHER SYSTEM

Summary: In-game system that allows the weather to change. Depending on the weather, certain crops may grow more efficiently— while others might become stunted. The weather system will directly influence gameplay (specifically crop growth for now), and the player will be able to change the weather by spending special resources.

Weather events will be separated into two categories: Natural Weather and Unholy Weather. Natural Weather can occur at any given time in the game (and through player action). Unholy Weather can ONLY occur through player action.

- Natural Weather: Eg. Rainy, Stormy, Dry, Sunny, Snowy, etc. Fair
- Unholy Weather: Eg. Locust Storm, Acid Rain, Chicken Rain

The player will be able to change the current Weather Event by interacting with a **Forecast Building** (Name TBD) and putting resources into it.

Hypothesis: The randomness of the weather system will add more unpredictability to the game, making it so that players must react accordingly to protect their crops. Additionally, it will provide players with another ‘sink’ to put their resources into in order to boost their cult’s efficiency.

FTUE: The player will be introduced to the weather event as part of the game’s tutorialization. They will attempt to grow crops during a Dry season and, upon realizing

that their crops efficiency is low, will be asked to use their Forecast Building to change the weather to Rainy.

Data:

Weather events will all have an individual temperature modifier. Every crop will also have a temperature threshold— they will grow at certain rates at different thresholds. Weather events will directly affect your cult's temperature and the growth rates of crops.

- Temperature modifier
- Direct crop modifier
- Likelihood
- Resource Requirements

Future Considerations:

Weather Events may affect more than just crop efficiency, but also the success rates of Influence Ops and Raids. For example, a poor Weather Event will make it so that all raids have a higher chance of cultist injury.
